WindProfiler,
RadioSounding

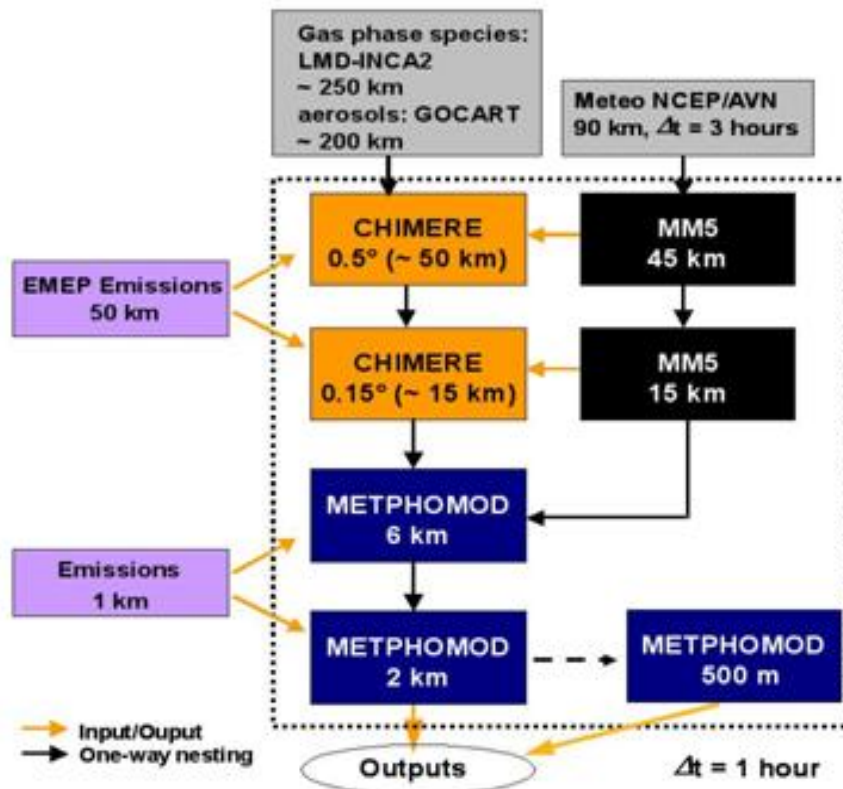

Outline

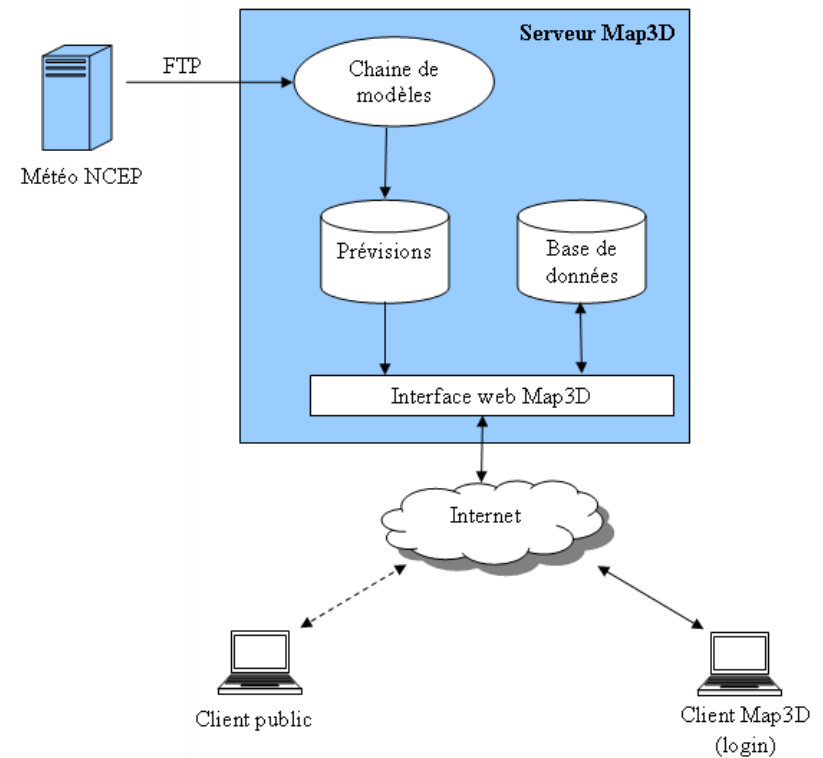

- Experience of air quality studies and Innogrants awards
- Description of the modelling chain
- **MAP3D** outputs and web interface
- Model results validation for the period of August 2008 - February 2009 for O_3 , O_x and PM_{10}
- Discussion and perspectives

Technical solution

Model Chain Set up

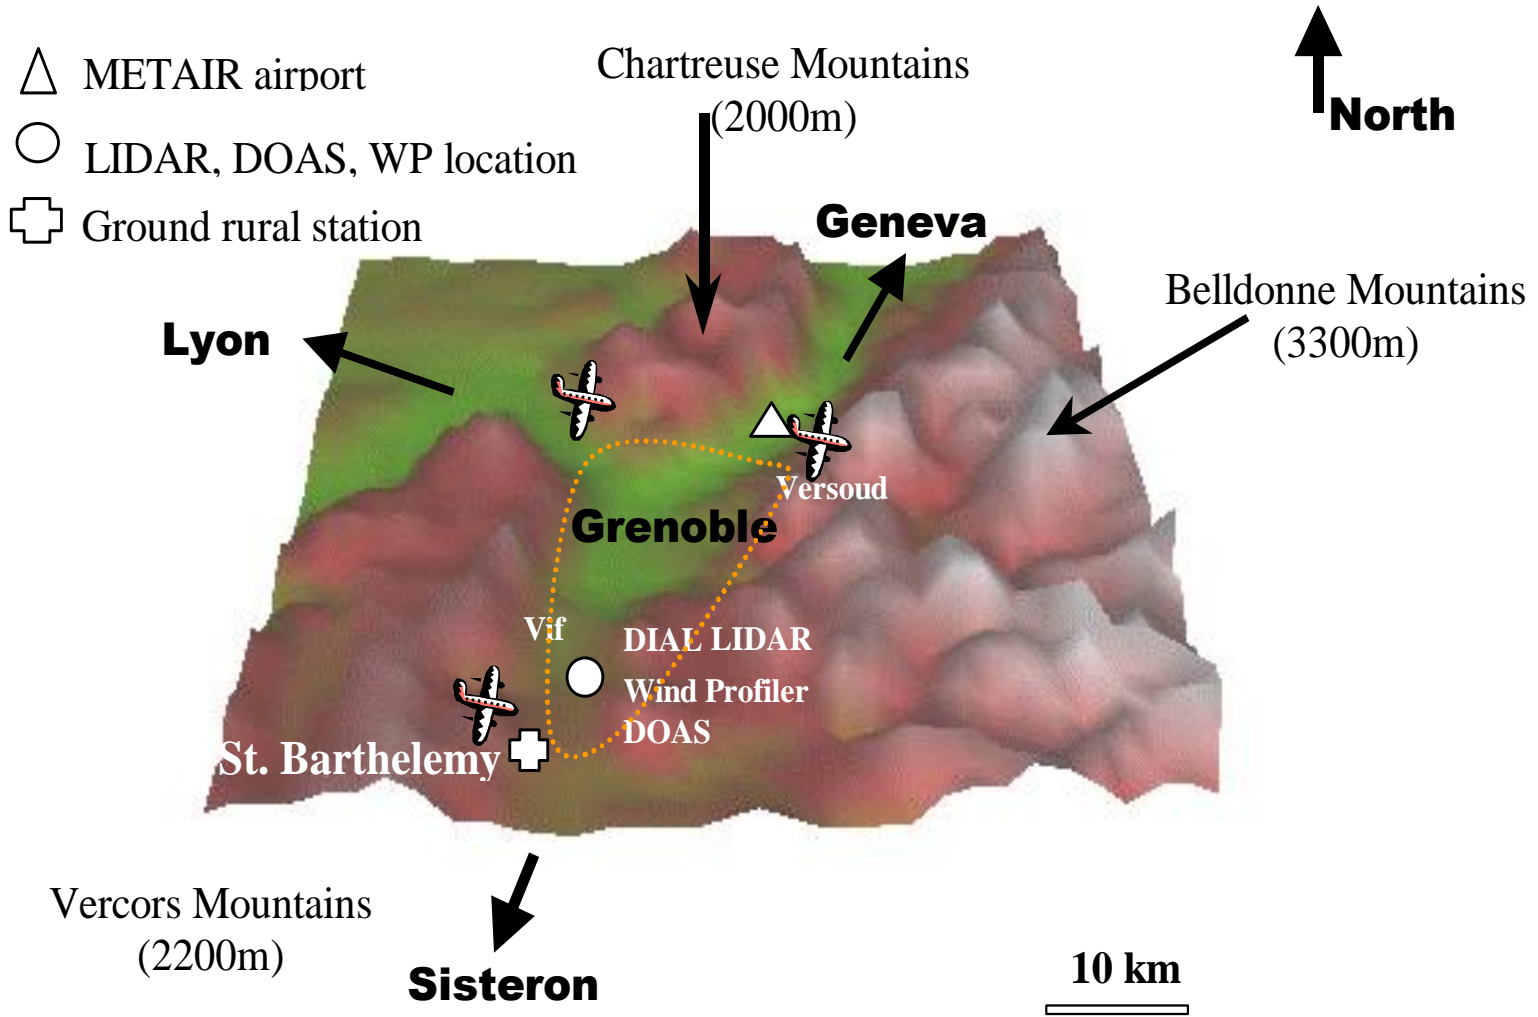

Computer Architecture

Map3D server :
Dell PowerEdge 2950 with Intel Quad-Core
Xeon 2,33GHz/2x4MB

- Complex Topography
- 3 D Monitoring
- 3 D Modeling
- Inter Validation
- Complex Chemistry

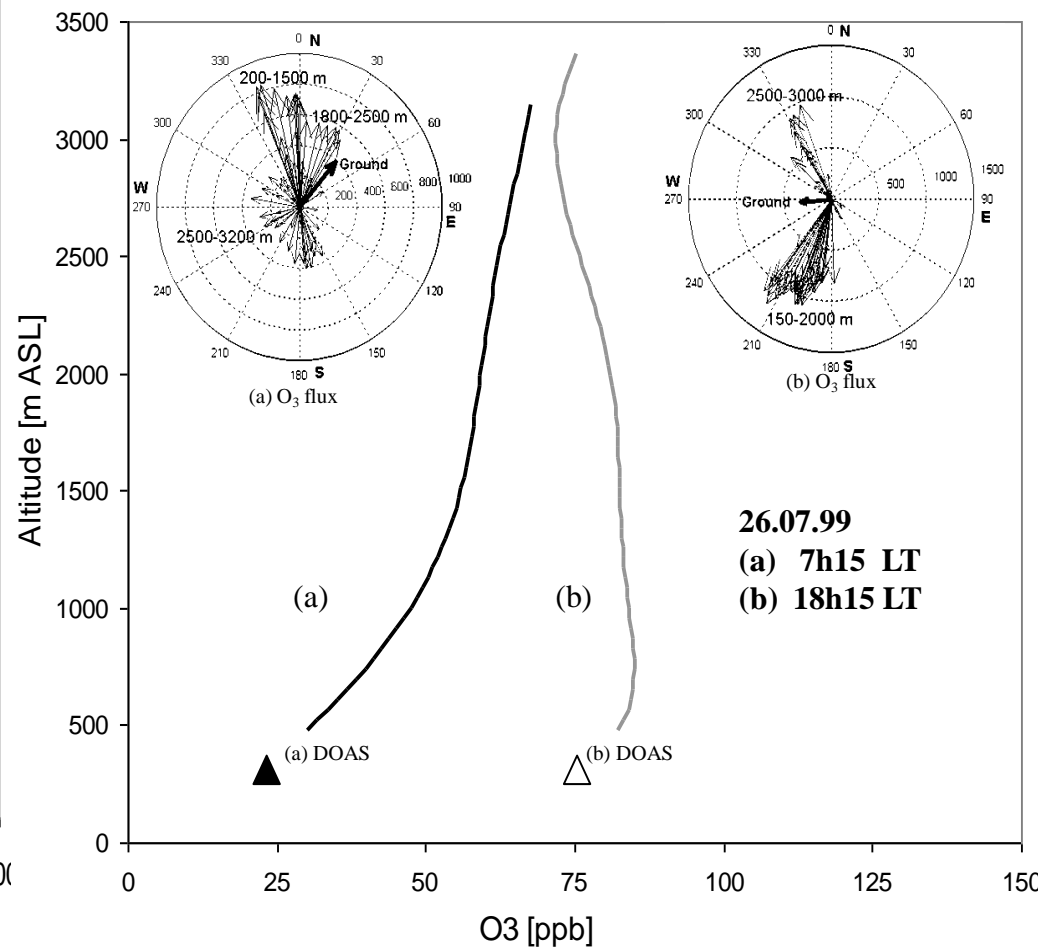

- Validation Comparisons
- Complement WindProfiler
- Complement DOAS
- Complement AirCraft
- Complement MODEL

OZONE : Profiles

Fluxes

3D - OZONE: LIDAR & MODEL

LIDAR

MODEL

Long experience of air quality studies in several European regions

Different case studies

- City of Grenoble in complex terrain
- Strasbourg area
- City of Geneva
- Greater Madrid area
- Greater Athens area

Model development

- Metphomod
- Model chain
- Chemical mechanism RACM
- Chemeta
- Air pollution indicators

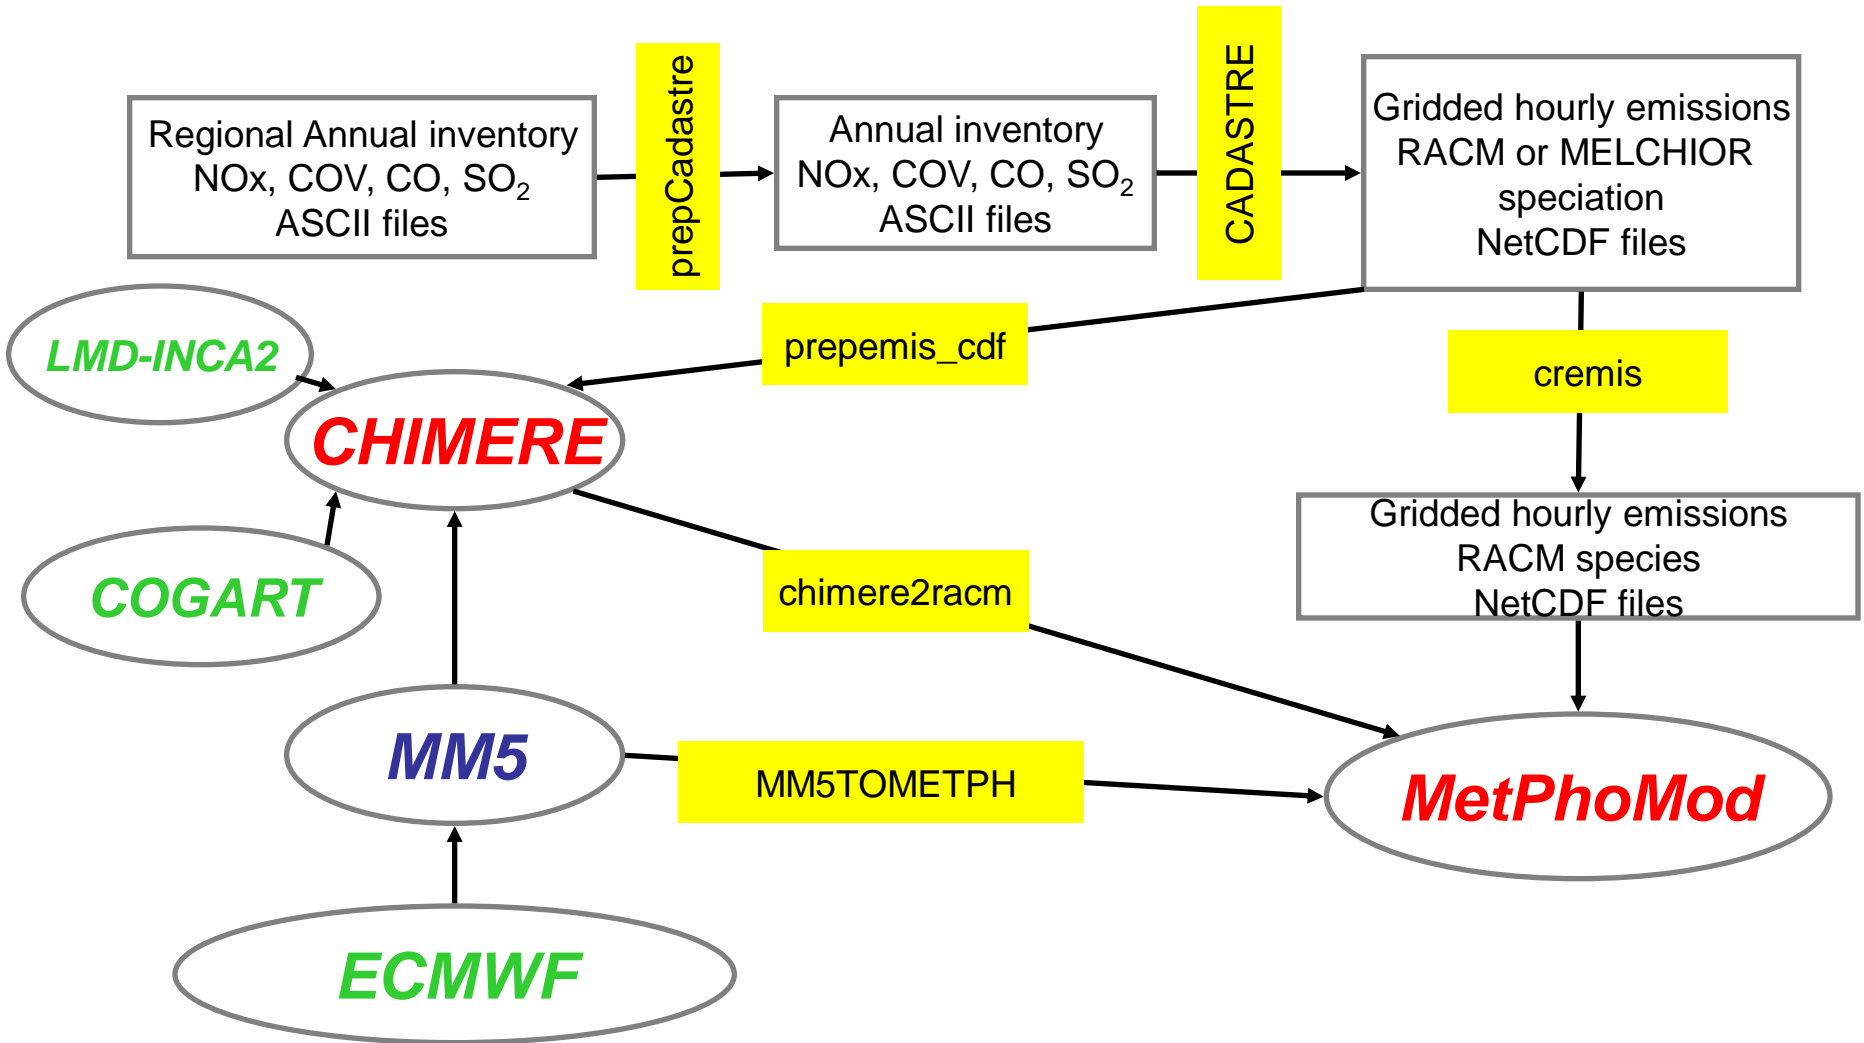

Grenoble Case
3D simulations
 O_3 , NO_2 and
wind

Our use of CHIMERE

- CHIMERE is used at boundaries of our model MetPhoMod
- Since CHIMERE has never been validated in very complex terrain our use of the model is limited to regional scales:
 - Continental for calculate background concentration in the Alps
 - Regional to account for main cities (Lyon, Geneva, Marseille, Torino) contributing to regional ozone

Technical schematic of the chain

Use of CHIMERE to constraint a fine scale model : MetPhoMod

- Problems and questions:

- How evaluate the quality of forcing by MM5 and CHIMERE ?
- Model have different horizontal meshes
Lambert, dx = 6 km/ Lambert 2 Etendu, dx = 2 km
- Model have different vertical descriptions
8 hybrid sigma levels/ 24 cartesian levels
- Models have different chemical mechanisms
MELCHIOR/ RACM

- Solutions:

- Perform comparison with 3D and ground data
- Perform horizontal interpolation
- Perform vertical interpolation
- Using only common species to both mechanisms

Our use of CHIMERE

- CHIMERE is used at boundaries of our model MetPhoMod
- Since CHIMERE has never been validated in very complex terrain our use of the model is limited to regional scales:
 - Continental for calculate background concentration in the Alps
 - Regional to account for main cities (Lyon, Geneva, Marseille, Torino) contributing to regional ozone

Correspondance between MELCHIOR and RACM

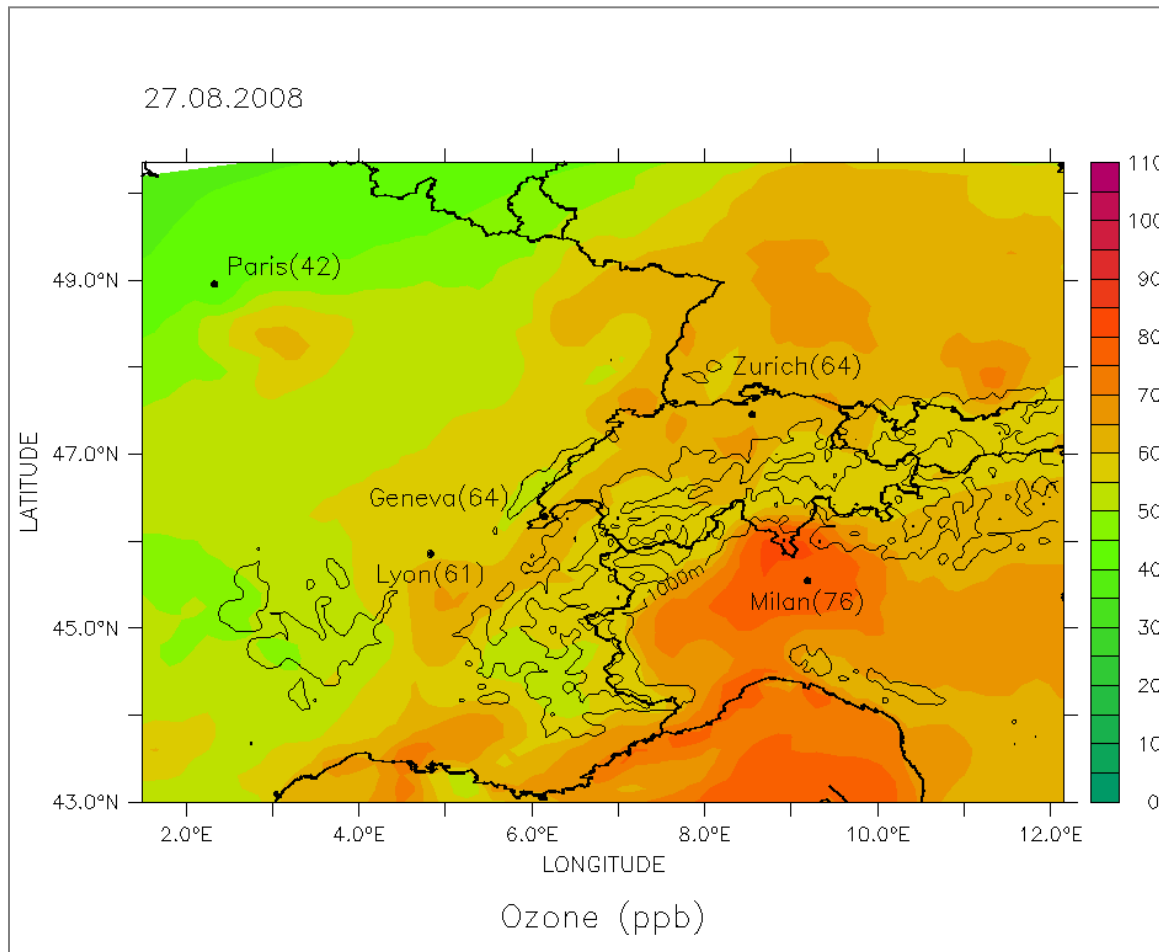

Nom MELCHIOR	Description MELCHIOR	Nom RACM	Description RACM
O ₃	ozone	O ₃	ozone
NO ₂	nitrogen dioxide	NO ₂	nitrogen dioxide
NO	nitric oxide	NO	nitric oxide
PAN	peroxyacetyl nitrate	PAN	peroxyacetyl nitrate ans higher saturated PANs
HNO ₃	nitric acid	HNO ₃	nitric acid
SO ₂	sulfur dioxide	SO ₂	sulfur dioxide
CO	carbon monoxide	CO	carbon monoxide
CH ₄	methane	CH ₄	methane
C ₂ H ₆	ethane	ETH	ethane
NC ₄ H ₁₀	n-butane	HC5	alkanes, alcohols, esters and alkynes with HO rate between $3.4 \cdot 10^{-12}$ and $6.8 \cdot 10^{-12} \text{ cm}^3 \text{ s}^{-1}$
C ₂ H ₄	ethene	ETE	ethene
C ₃ H ₆	propene	OLT	terminal alkenes
OXYL	o-xylene	TOL	toluene and less reactive aromatics
C ₅ H ₈	isoprene	ISO	isoprene
APINEN	α
.
.
.
.
.

20 species
from CHIMERE
are related to
RACM species

Table : correspondance between MELCHIOR and RACM species

Map3D outputs and web interface

Ozone concentration [ppb] with 15 km resolution for Switzerland

Access to the forecast results and to a personalized web interface via login

- three days weather and air pollution forecast: Hourly concentrations for ozone, PM10, PM2.5 and NO₂. Other chemical compounds such as NO, NO_x, SO₂ or CO can be added to the output.
- access to a database containing all these species. The concentration values can be extracted in text, netCDF or ESRI format
- validation of the data by comparison to values from measurement stations
- indicator values helping to estimate whether NO_x or VOC emissions must be lowered in order to reduce the ozone concentrations

Ozone simulation and forecast

PM10 simulation and forecast

Conclusion & Perspectives

MAP3D

the acronym for "Mesoscale Air Pollution 3D modeling" is today successfully developed after 1.5 year of work and is available for environmental administrations, urban air quality agencies, industries, and decision makers.

Strengths

- Strong expertise in atmospheric science and modeling software
- Daily forecast of meteorological fields and pollutant concentrations (gases and aerosols) at regional and urban scales and over complex and mountainous terrains
- Daily indicators calculation for localization of air mass ozone regimes control
- User friendly and customizable web-based interface
- Impact scenario studies (new projects, infrastructure measures or short-term abatement policies)

Map3D - -----> RO

- Possibility of connecting the MAP3D results and forecasts to the Romanian measurement network data (air pollution and meteorological data) by developing an interface module (ftp access to the measurement data needed)
- Possibility to develop a module for geo-referencing the simulations results in order to relate the calculated concentrations for example to the population density calculating a map with ppb/habitants
- A data base will be built containing all the data of pollution episodes. This data base allows classifying the episodes and provides the data needed for running emission reduction scenarios.
- Daily 3D Output allows comparing the model results to O3 and aerosol lidars as well as to PBL measurement (cf. Atmos. Environ. Couach et al. 2004)
